

Sample count at each stage (note: NOT nested)

The H2 'platform-controlled' result rests on 3 datasets, 60 samples

Reconciliation: CCC graph (148) = labelled & graphed (119) + graphed without malignancy label (29: 10 healthy donors + 19 AML samples); a further 11 samples are labelled but never graphed. Those 19 unlabelled AML samples have their frac_malignant filled with the global mean at 01_build_fgw_inputs.R:72 -- i.e. handed a malignant fraction that was never measured.
