Cell type, 57 clusters at resolution 1.0

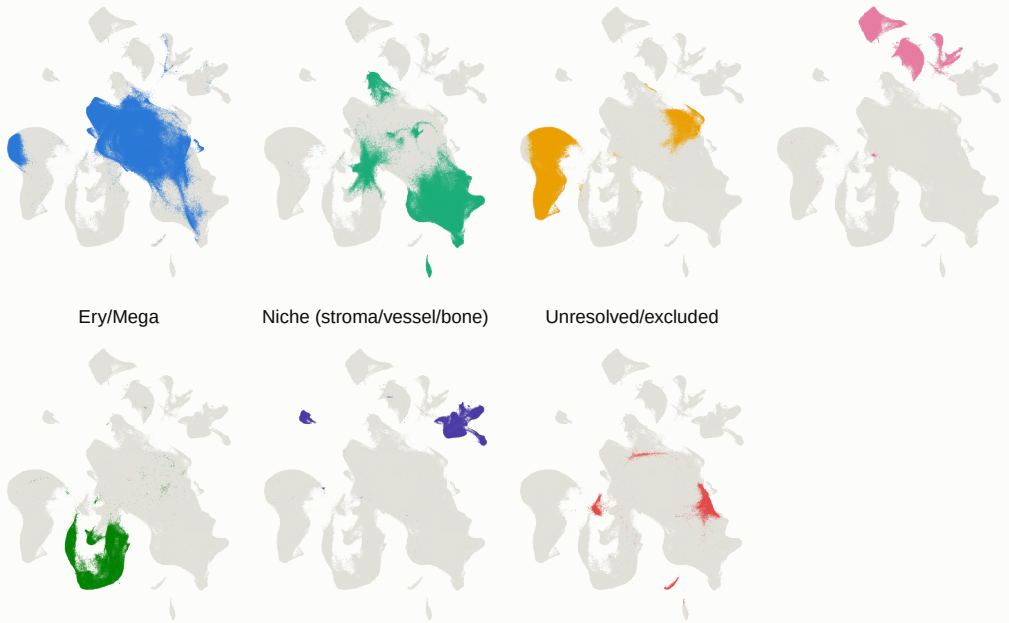

895,228 cells | 9 datasets | 182 samples | no malignancy claim on this axis | ids where n > 8,000

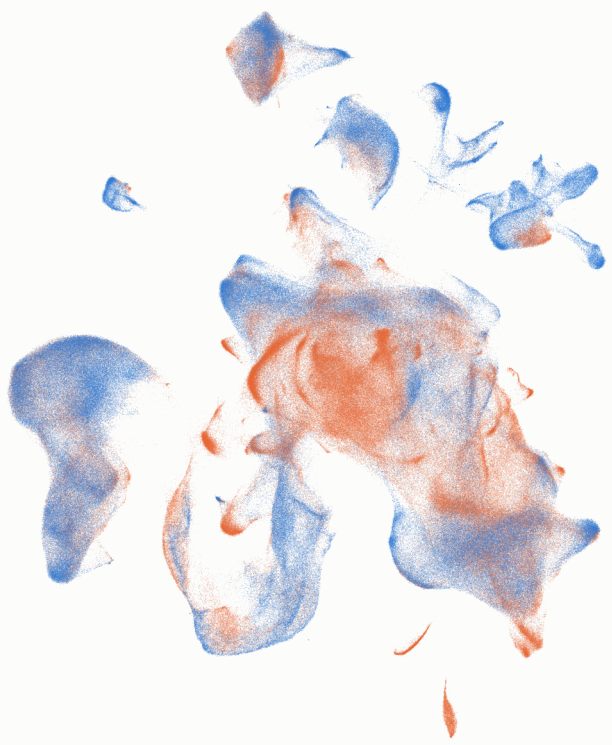

The same seven groups, one panel each

grey = all other cells, so each group is read against the whole manifold

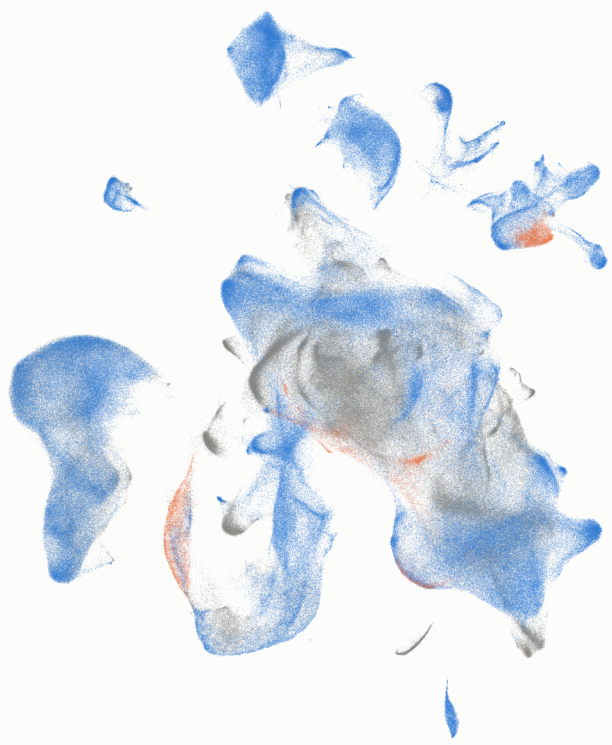

AML vs Control

107 AML / 75 Control samples

Malignancy: the second axis, assigned on evidence

of 476,368 cells from AML donors: 72.9% undetermined, 21.7% normal, 5.4% malignant

Malignancy status within each cell−type group

grey = the evidence cannot separate blast from its normal counterpart; table view: ws_composition_table.csv
